BUYER'S GUIDE

The seven pillars of a verifiable peptide purchase.

A BUYER'S DECISION GUIDE

Before you buy *peptides.*

What to look for before you order from anyone, including us.

SEVEN PILLARS · TEN-POINT CHECKLIST · READ IN FIFTEEN MINUTES

AEVIVO LONGEVITY · MMXXVI

FOR RESEARCH USE ONLY
NOT FOR HUMAN CONSUMPTION

INTRODUCTION

I. Most buyers have no way to verify what they're receiving.

Peptides are everywhere. Rigor is rare. This guide is a short, practical framework for telling the difference. A working document, not a brochure.

The peptide market has expanded faster than the discipline around it. Alongside it, a quiet secondary market of vague suppliers, recycled certificates, and prices that are too low to make sense. Most buyers have no trained way to tell a serious supplier from a surface one, and the language the industry uses, "pharmaceutical grade," "research grade," "EU sourced," is frequently untethered from any verifiable claim.

What follows is seven things that matter, one short section each, plus a one-page checklist you can print and a worked example of a credible Certificate of Analysis. Read it in under fifteen minutes. Keep it on hand. Use it before you order, *from anyone, including us*.

> A NOTE ON LANGUAGE
>
> All compounds discussed here, and all products supplied by Aevivo, are **For Research Use Only**. This document does not discuss human administration, dosing, or therapeutic use. It discusses how to buy research material responsibly.

INSIDE THIS GUIDE

I. Purity · HPLC & % area
II. Identity · mass spec
III. Origin & provenance
IV. Delivery format
V. Storage & shipping
VI. Pricing signals
VII. Supplier identity
The ten-point checklist

Plus a worked example of a credible Certificate of Analysis.

AT A GLANCE

II. The seven things that matter.

Use the framework below when evaluating any peptide supplier, online or off. In our experience, most failures in the peptide supply chain are a missing answer in one of these seven categories.

I.

Purity

What percentage of the product is actually the target compound, measured by HPLC with a chromatogram attached.

II.

Identity

Proof, via mass spectrometry, that the compound is the one the label claims. Theoretical mass vs observed mass.

III.

Origin

Country of synthesis, named facility, certifications. What was made where, by whom, to what standard.

IV.

Delivery Format

Lyophilised vial, pre-filled vial, or sealed pen cartridge. These are not equivalents. They are different products.

V.

Storage & Shipping

Cold-chain handling, arrival inspection window, written damage and documentation policy.

VI.

Pricing Signals

What a fair price looks like across formats, and what a dangerously low one tells you is missing.

VII.

Supplier Identity

Named humans, registered entity, direct support channel, written policies. A reputation someone wants to keep.

How to use this map

Seven questions, one decision.

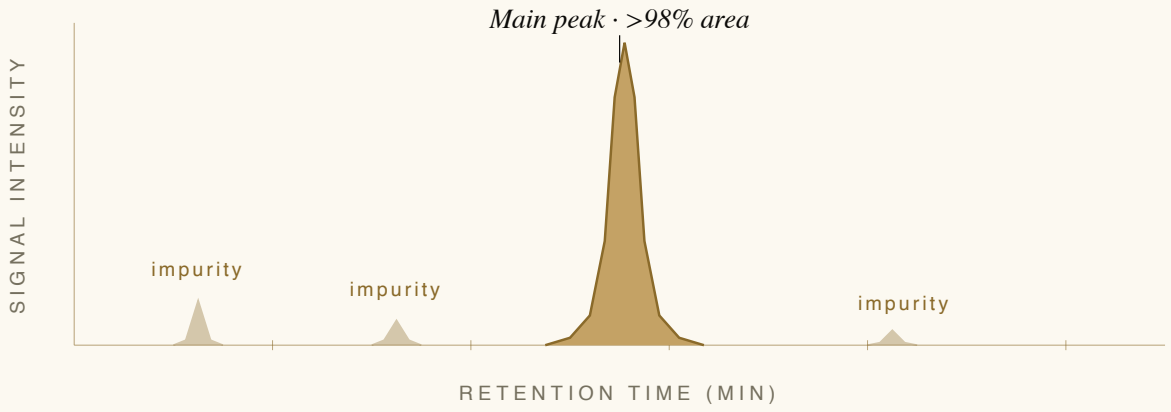
Run every supplier through the seven. If two or more answers are missing, silent, or vague, treat the supplier as unverified until they close the gaps in writing.

I. THE PURITY QUESTION

I. Purity is the first test. Most suppliers fail it.

When a peptide is synthesised, the process produces a mixture: the target compound plus incomplete chains, deletion sequences, and synthesis by-products. "Purity" is the proportion of the final product that is the target compound. It is measured by High-Performance Liquid Chromatography, or *HPLC*.

FIG. I - SIMPLIFIED HPLC CHROMATOGRAM



A credible CoA shows the full trace, not just a percentage.

WHAT TO LOOK FOR

- A chromatogram image showing the main peak *and* the smaller peaks around it.
- A numeric percentage next to the main peak, labelled as *% area*.
- A *release specification* (the minimum the supplier commits to) and a *lot result* (actual measurement for this batch).

RED FLAG

A generic PDF with no batch number, no chromatogram, or a percentage quoted with no supporting trace.

WORKED EXAMPLE · TYPICAL RELEASE LINE

Release spec: ≥97% · **Lot 25AUG03:** 98.4% by HPLC area at 6.477 min

The spec is what the supplier commits to. The lot result is what *this* batch actually tested at. A credible CoA shows both, so you can verify every shipment without having to trust a marketing figure.

> *A percentage without a trace is a marketing figure, not a measurement.*

II. IDENTITY

II. Verify the compound is the compound on the label.

HPLC tells you the main peak is some percent of the total. It does not tell you *what* that peak is. Credible suppliers run mass spectrometry, or *MS*, to confirm it.

Mass spec reports two numbers side by side: the **theoretical mass** (what the target molecule should weigh, calculable from its chemical formula) and the **observed mass** (what was actually measured in the sample). If the two match within a small tolerance, the compound is what the label claims.

> WORKED EXAMPLE · EPITALON
>
> **Theoretical mass:** 390.35 Da · **Observed mass:** 390.36 Da
>
> A 0.01 Da delta is well within instrument tolerance. Identity confirmed.

WHAT TO LOOK FOR

- An MS spectrum image *or* a table showing theoretical vs observed mass.
- The peptide sequence spelled out on the CoA (for Epitalon: *Ala-Glu-Asp-Gly*).
- For recombinant peptides, a separate N-terminal or DNA-sequencing check of the expression strain.

> RED FLAG
>
> Purity data shown but no identity verification. A peak of "99% purity" could be almost anything of the right molecular size.

> *Purity without identity is a pretty chart of an unknown compound.*

> THREE QUESTIONS TO ASK ANY SUPPLIER
>
> 1. *Can I see the mass-spec spectrum for this compound?*
> 2. *What is the theoretical mass, and what was observed?*
> 3. *Is the sequence printed on the CoA?*
>
> A supplier that can answer all three on request has an analytical chain behind the product. One that cannot is selling a label.

III. ORIGIN & PROVENANCE

III. Country of synthesis is part of the product.

The peptide market has three broad origin classes. They produce very different products at very different price points. Knowing which class your supplier actually operates in, not which one they market themselves as, is the single highest-leverage question you can ask.

EU

European GMP

REGULATED · AUDITED

Highest cost, highest trust. Named facility, documented inspections.

US

US Research Labs

VARIABLE QUALITY

Credible at the top end. Ask for certifications. Origin language is often loose.

ASIA

Bulk Suppliers

CHEAPEST · LEAST VERIFIABLE

Often resold as "EU" by Western packagers. Some batches are fine; without a named facility, you cannot know which.

THE RESALE TRICK

Many Western European and US "research-grade" suppliers buy bulk raw material from manufacturers in China, Pakistan, or India, repackage it in a cleaner box, and market it as EU-synthesised. Some of that material is perfectly fine. Some of it is not. *Without a named facility, there is no way to know which.*

WHAT TO LOOK FOR

- A *named* manufacturing facility and country on the CoA or product page.
- A GMP certificate number or equivalent regulatory reference.
- A direct answer to the question "who made this, and where?" Not a brochure sentence.

RED FLAG

"EU research-grade," "pharma-grade," or "GMP-inspired" with no named facility, no country, and no certification documents to request.

IV. DELIVERY FORMAT

IV. How the peptide arrives changes what you received.

Research peptides reach buyers in three formats. They are not interchangeable. The format determines stability, contamination risk, dosing reproducibility, and price.

CHEAPEST

Lyophilised vial

- Freeze-dried powder in a glass vial.
- Buyer reconstitutes with water.
- Measurement error at reconstitution.
- Each puncture adds contamination risk.

MID-TIER

Pre-filled vial

- Ready-mixed liquid in a glass vial.
- Still requires septum puncture per use.
- Each use exposes compound to air.
- Dose measured by syringe by hand.

PREMIUM

Sealed pen cartridge

- Closed system. No septum puncture.
- Dial-based precision dosing.
- Inert atmosphere inside the cartridge.
- Reproducible dose across the series.

RED FLAG

The supplier does not specify the delivery format on the listing, provides no written storage protocol, or sells only lyophilised powder with no reconstitution guidance.

> *A vial is raw material. A pen is a delivered system.*

CROSS-REFERENCE · THE PRICE STORY

Because pens and vials are categorically different products, they are priced categorically differently. A pen typically runs **3-5×** the equivalent vial price for the same compound. *See page 08 for why.*

THE PRICE STORY

Pens and vials are not the same product.

> *Comparing a vial to a pen is like comparing flour to bread. Both contain the same ingredient. One of them is ready to use.*

This is the most common mistake buyers make: assuming a pen and a vial of the same peptide should cost roughly the same. They should not. They are categorically different products at different points in the manufacturing chain.

WHAT YOU GET IN A VIAL

The compound, dissolved or lyophilised, in a glass container with a rubber septum. The buyer provides: the needle, the syringe, the reconstitution water (if lyophilised), the sterile technique, the dose measurement, and the risk of every one of those steps going wrong.

WHAT YOU GET IN A PEN

The compound, pre-dissolved in a stability buffer, sealed inside a medical-grade cartridge under inert atmosphere, loaded into a dial-dosing device, tested for sterility and endotoxin levels, and formulated for refrigerated shelf life. No reconstitution, no puncture, no dose guesswork.

> **WHY PENS COST THREE TO FIVE TIMES MORE**
>
> You are not paying 3-5× as much for peptide. You are paying for the dissolution, the buffer, the stabilisers, the sterile fill-and-finish, the inert-gas seal, the dial mechanism, the sterility testing, and the quality release process. *The peptide is the cheapest ingredient on that list.*

> **AT A GLANCE**
>
> A vial is raw material. A pen is a delivered system.
> Pens typically run **3-5×** the equivalent vial price for the same compound. Real manufacturing cost, not markup. Compare pen-to-pen, vial-to-vial, lyo-to-lyo. Any supplier quoting across formats to make themselves look cheaper is either confused or hoping you are.

V. STORAGE & SHIPPING

V. Most peptides that arrive broken were broken in transit.

Peptides are proteins. Many of them degrade above certain temperatures. A compound that ships ambient across a warm climate in July may arrive intact in structure but with reduced potency that no visible inspection will reveal. Cold chain is not a luxury add-on. It is the difference between a compound you can use and a compound that looks correct and behaves incorrectly.

> TYPICAL STORAGE WINDOW
>
> **+2°C to +8°C refrigerated.** Most liquid peptide formulations. *Do not freeze.* Freeze-thaw cycles denature many compounds. Keep away from direct light and heat; UV and high temperature accelerate degradation.

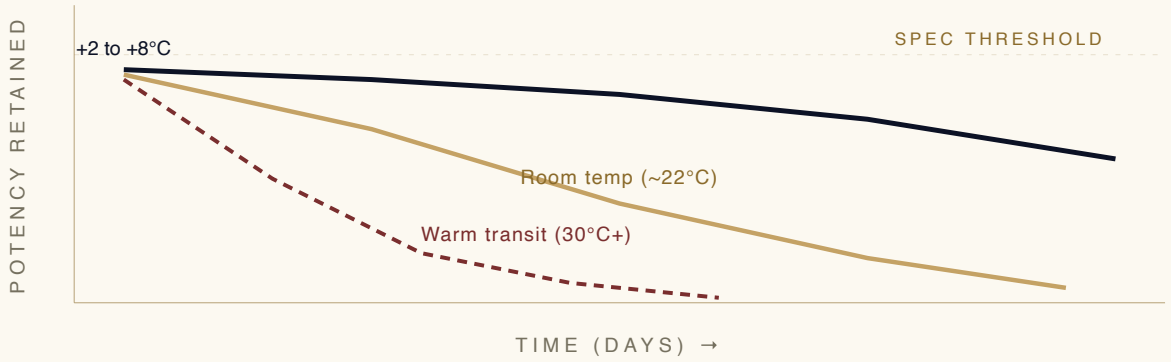
WHAT TO LOOK FOR

- A named storage temperature range on the CoA *and* the product listing.
- Cold-chain shipping (gel packs, insulated box) where destination climate or compound stability requires it.
- A temperature indicator or data-logger inside the package where the compound is sensitive.
- Written instructions for what to check on arrival: appearance, temperature strip, documentation match.
- A 24-72h inspection window to report damage or documentation issues.

> RED FLAG
>
> No storage temperature specified, no indication of cold-chain packaging, and a shipment that arrives warm in a padded envelope. There is no way to tell whether the compound is still intact.

> *Cold chain is not packaging. It is a documented decision to treat the compound as what it is.*

FIG. II - STABILITY VS TEMPERATURE (ILLUSTRATIVE)



Degradation is invisible on arrival. The temperature curve that got it here is what matters.

VI. PRICING SIGNALS

VI. Prices that look too good usually are.

Each step in a legitimate peptide supply chain has a real cost. GMP synthesis, HPLC purification, analytical QC, sealed-pen formulation, sterility and endotoxin testing, cold-chain shipping. A supplier charging significantly below market is either absorbing losses they cannot sustain, buying lower-grade raw material, or skipping steps.

We are not publishing a price table. Peptide prices shift quarterly, and published numbers lag reality. The better rule: get quotes from at least three suppliers for the same compound at the same spec and the same delivery format. If one is 40% below the other two, the 40% is a signal, not a deal.

HOW TO COMPARE PROPERLY

Compare **pen to pen**, **vial to vial**, **lyo to lyo**. Match the total compound mass (mg), not the container size. Any supplier quoting across formats to look cheaper is either confused or hoping you are.

RED FLAG

A price far below market paired with no CoA, no named manufacturer, no defined delivery format, and no return policy. Each missing piece is a real cost that someone decided not to pay.

> *A price 40% below market is not a deal. It is a data point about what was cut.*

FIG. III - WHAT YOU PAY FOR IN A PEN (ILLUSTRATIVE)

The peptide itself is the smallest line. Everything else is the manufacturing chain that gets it safely in front of you.

VII. WHO YOU ARE BUYING FROM

VII. A named human beats an anonymous LLC every time.

If something goes wrong with a compound, a shipment, or a documentation gap, you want a person to talk to. This is the single most underweighted factor in peptide purchasing and the one most likely to matter when you need it.

WHAT TO LOOK FOR

- Named founders or leadership on the supplier's site.
- A registered business entity with a real address and country of registration.
- A direct support channel, not just a generic contact form.
- A written refund and quality policy.
- Evidence of operational longevity and a reputation worth protecting.

RED FLAG

Anonymous brand, no team page, only a generic contact form, no registered address, and no written policy to hold anyone to.

> *A registered address is not trust. It is the minimum condition for accountability.*

ANATOMY OF A CREDIBLE SUPPLIER PAGE

NAMED TEAM	Founders and key staff pictured, with roles and direct contact.
LEGAL ENTITY	Registered company name, country, and postal address in the footer.
SUPPORT CHANNEL	A direct email, phone, or WhatsApp. Not only a contact form.
WRITTEN POLICIES	Terms, privacy, refund and quality policies published on the site.
OPERATIONAL DEPTH	Years in operation, prior batches, customer count, reputational evidence.

THE CHECKLIST

Ten questions for any peptide supplier.

Run this before every order. If more than two answers are *no*, treat the supplier as unverified until they close the gaps in writing.

		Y	N
01	Is the country of synthesis named on the CoA or product page?	☐	☐
02	Is a GMP or equivalent facility certification documented?	☐	☐
03	Is a Certificate of Analysis available for the specific compound?	☐	☐
04	Does the CoA show ≥97% purity by HPLC?	☐	☐
05	Does the CoA include mass-spectrometry identity confirmation?	☐	☐
06	Is the delivery format (lyo, pre-filled vial, pen) specified?	☐	☐
07	Is a storage protocol provided, with cold-chain where needed?	☐	☐
08	Is pricing within a reasonable market range for the spec?	☐	☐
09	Is a human or named entity clearly responsible for the supply?	☐	☐
10	Is there a direct support channel and a written quality policy?	☐	☐

APPLIED EXAMPLE

What a credible CoA actually looks like.

Every line below is either numeric or traceable. Nothing is marketing language.

SIMPLIFIED COA SUMMARY

PRODUCT	Epitalon
LOT	25AUG03EPI
FACILITY	Named EU GMP-certified manufacturer *(on record, shared on reservation)*
PURITY (HPLC)	Main peak at 6.477 min, *99.13%* area
IDENTITY (MS)	Theoretical 390.35 Da · Observed 390.36 Da
RELEASE SPEC	≥97% · Lot result >98%
STERILITY	Complies (Eur. Pharm. inoculation method)
ENDOTOXIN	< 0.20 EU/mg (limit < 10)
STORAGE	+2 to +8°C · Do not freeze
EXPIRY	08 / 2027

Ten data points. Together they answer whether the compound is what the label says, whether this specific batch meets a purity threshold you can verify, and whether the manufacturer is traceable and accountable. When a CoA gives you this much, you have something to work with. *When it does not, you are trusting a brochure.*
